## FORSYS ADDS FOURTH DRILL RIG TO TEST NORTH ANOMALY AT VALENCIA

FOR IMMEDIATE RELEASE: JUNE 27, 2008

Forsys Metals Corp (“Forsys” or the “Company”) is pleased to announce that the Company has added a fourth percussion drill rig to the ongoing 30,000 m percussion drilling program underway at its 100% owned Valencia Uranium project (“Valencia”) located in Namibia, Africa.

The fourth rig was added in order to accelerate drilling activity prior to the updating of the resource/reserve estimate on the Valencia deposit. The north radiometric anomaly was identified from recent ground geophysical surveys completed over the entire Valencia ore body. The anomaly is located within the initial open pit shell design, as described in the 2007 NI 43-101 Technical Report, however it has never been drill tested.
